
Addendum to the Instruction Manual: All Orion® Intelliscope® Dobsonian Telescopes

Enclosed you will find a replacement vertical stop knob. The vertical stop knob supplied with your IntelliScope base is too thick to allow the correct "Point Vertical" position to be achieved. This will result in inaccurate readouts on the IntelliScope Object Locator. Please use the knob included with this kit, and discard the knob that came with the base. Refer to Figure 1 to determine the correct knob if you are unsure. Once you have identified the correct knob, continue to follow the directions in the IntelliScope Object Locator manual regarding, "Adjusting the Vertical Stop."

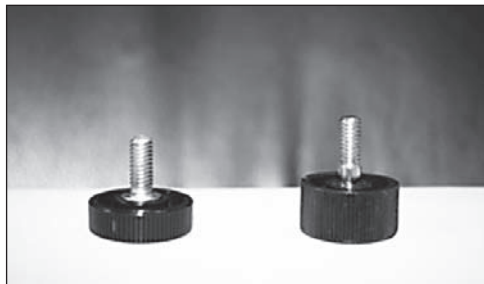

Figure 1: The vertical stop knob on the left has a thinner head. This is the correct vertical stop knob to use. The knob on the right is incorrect and should be discarded.
