

Release Notes - SynScan Ver. 4.39.05 Firmware

What's new in this update?

1. Updated and corrected the Solar Tracking speed in the Solar Track Mode. The Solar Track Mode is a new function to track the Sun and does not need an alignment.

To use this Solar Track Mode function:

- a) Polar align the equatorial mount or level the base of the Alt-Az mount.
- b) Finish the initialization on SynScan. No alignment is needed.
- c) Activate "Solar Track Mode." Now the mount will start working at solar tracking speed until exiting the "Solar Track Mode".
- d) Center the Sun in FOV with SynScan hand controller. ***Make sure you have a proper solar filter mounted on the front of your telescope and any finder scope you're using.***
- e) Start observing.

2. Minor bug fixes.
